

Pytest

- First we need to install a package
- To install a package use your file menu and choose settings (windows/linux)
 - (mac users might have settings in another menu) – preferences in the pytest menu if I recall
 - From the resulting dialog choose
 - Project: <your project name>
 - Now choose Project interpreter

Installing a package

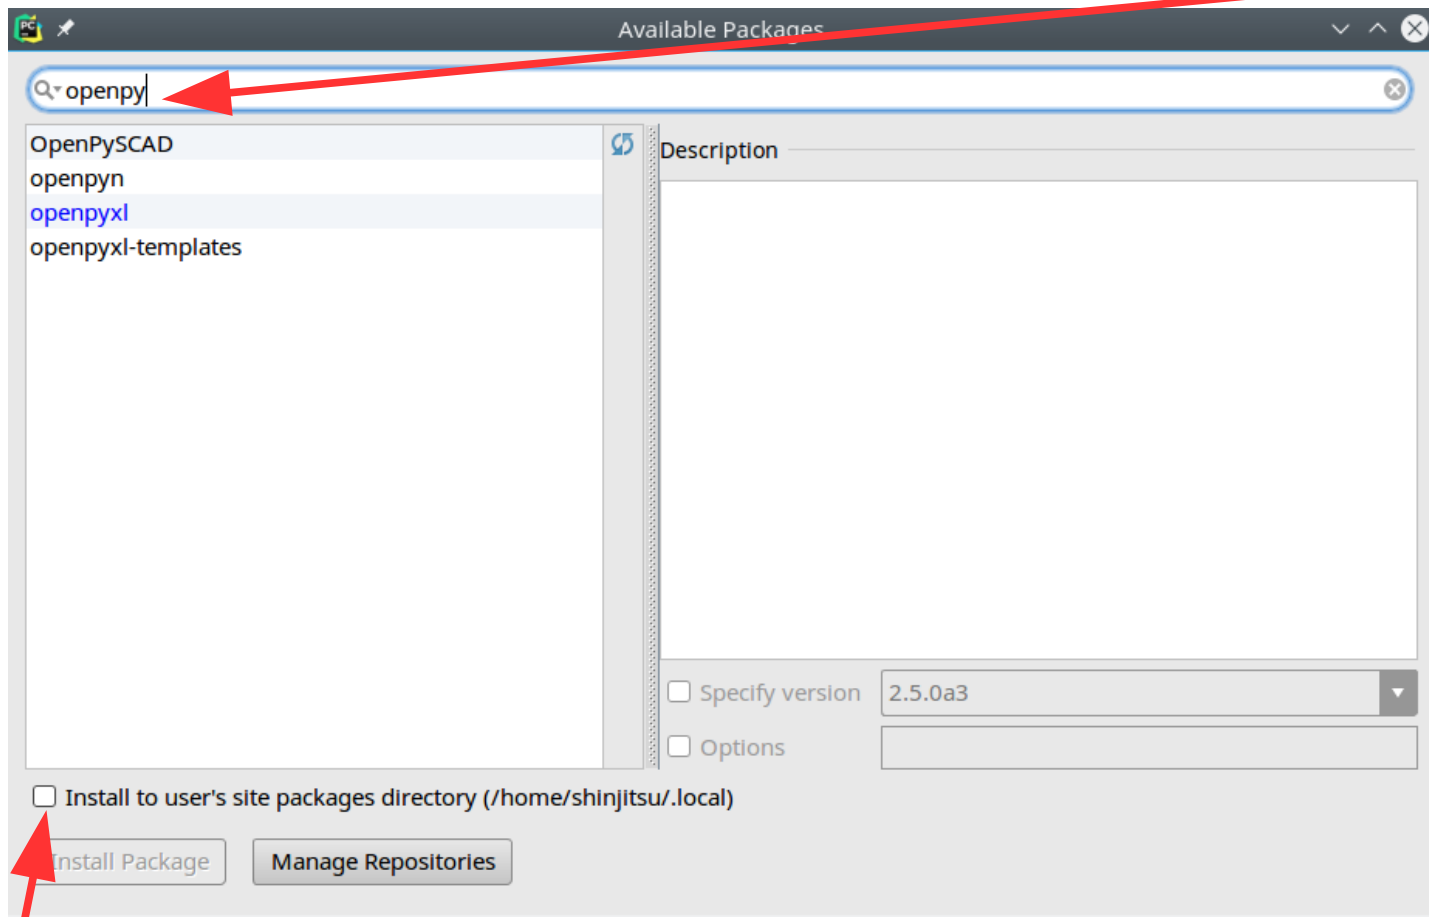

- Now you should see something like this: (I probably have more packages than you)

- Find the green '+' (Either windows or mac has it in the lower left – my image comes from linux)

Installing a package II

- There are thousands of packages, type the beginning of the name in the search area (pytest)

- If you don't have admin on your machine install to site packages
