

Software Dev

It works on my machine and how to develop
more professionally

Admin

- Quizzes /assignment discussion
- Assignment here?
- Or next class?

Works on my machine

- Discuss the history
 - For a while I got a reputation for this
 - So I dropped it
 - But this semester I'm hearing more and more works on my machine.
 - You don't get downloaded and installed with the software

From my door

Works on my machine

- What we are doing here is (perhaps unconsciously) blaming the users
 - Yes I say this in jest (users are the worst thing that can happen to your software)
 - But in real life our software should take users into account

Works on My machine

- As per articles, several reasons that it doesn't work for your customers
 - Bad user interface
 - customer doesn't know how to use the program
 - Broken build/untested/buggy
 - Someone someone snuck a bug into production code.
 - Environmental problems
 - Missing/confused dependencies/'dll hell'
 - Lets take a look at these one at a time

Bad User interface

- The most infamous example in the year 2019 of bad user interface?
 - Including an initial corporate response that was functional equivalent to blaming the user?

Bad User interface

- The most infamous example in the last year of bad user interface?
 - Including an initial corporate response that was functional equivalent to blaming the user?
 - Boeing 737 MAX
 - “A long-standing procedure taught to pilots could have halted the dive, according to the regulator and the manufacturer. The FAA ordered airlines to add an explanation into flight manuals,”
 - Boeing response to the Lion Air crash Oct 2018
 - When did Boeing add information about the AI system that caused the crash to the manuals and other information given to pilots?

Bad User interface

- The most infamous example in the last year of bad user interface?
 - Including an initial corporate response that was functional equivalent to blaming the user?
 - Boeing 737 MAX
 - When did Boeing add information about the AI system that caused the crash to the manuals and other information given to pilots?
 - A week after the first crash
 - <https://www.extremetech.com/extreme/280521-boeing-737-crash-caused-by-new-safety-system-pilots-werent-told-existed>

Lesson

- If your interface kills people it isn't 'operator error'
 - We appear to finally be leaving this era
- Three Mile Island story
 - The beginning of the 'operator error' approach
 - As far as I know

Bad User Interface Example 1

- One of our current administrative software:
 - How do you supposed we select an application?
 - See next slide

They also call out this

Final Example

- Remember the ddos attack from a few years back that took down the east coast internet?
- October 21 2016
 - <https://www.wired.com/2016/10/internet-outage-ddos-dns-dyn/>
- Why? What happened?

Final Example

- Remember the ddos attack from a few years back that took down the east coast internet?
- October 21 2016
 - <https://www.wired.com/2016/10/internet-outage-ddos-dns-dyn/>
- IoT devices taken over and a good chunk of the East Coast Internet went offline.
- why/how were these IoT devices taken over and added to a botnet?
- Hint – what do these devices tell you to do first?

Final Example

- Remember the ddos attack from a few years back that took down the east coast internet?
- October 21 2016
 - <https://www.wired.com/2016/10/internet-outage-ddos-dns-dyn/>
- IoT devices taken over and a good chunk of the East Coast Internet went offline.
- why/how were these IoT devices taken over and added to a botnet?

Final Example

- Remember the ddos attack from a few years back that took down the east coast internet?
- IoT devices taken over and a good chunk of the East Coast Internet went offline.
- why/how were these IoT devices taken over and added to a botnet?
- **Users never changed the default password**
-

Final Example

- IoT devices taken over and a good chunk of the East Coast Internet went offline.
- why/how were these IoT devices taken over and added to a botnet?
- **Users never changed the default password**
- How would you as developers fix this issue with users?

Final Example

- IoT devices taken over and a good chunk of the East Coast Internet went offline.
- why/how were these IoT devices taken over and added to a botnet?
- **Users never changed the default password**
- How would you as developers fix this issue with users?
 - Make device not work till the default password is changed
 - Good first start.

Usability

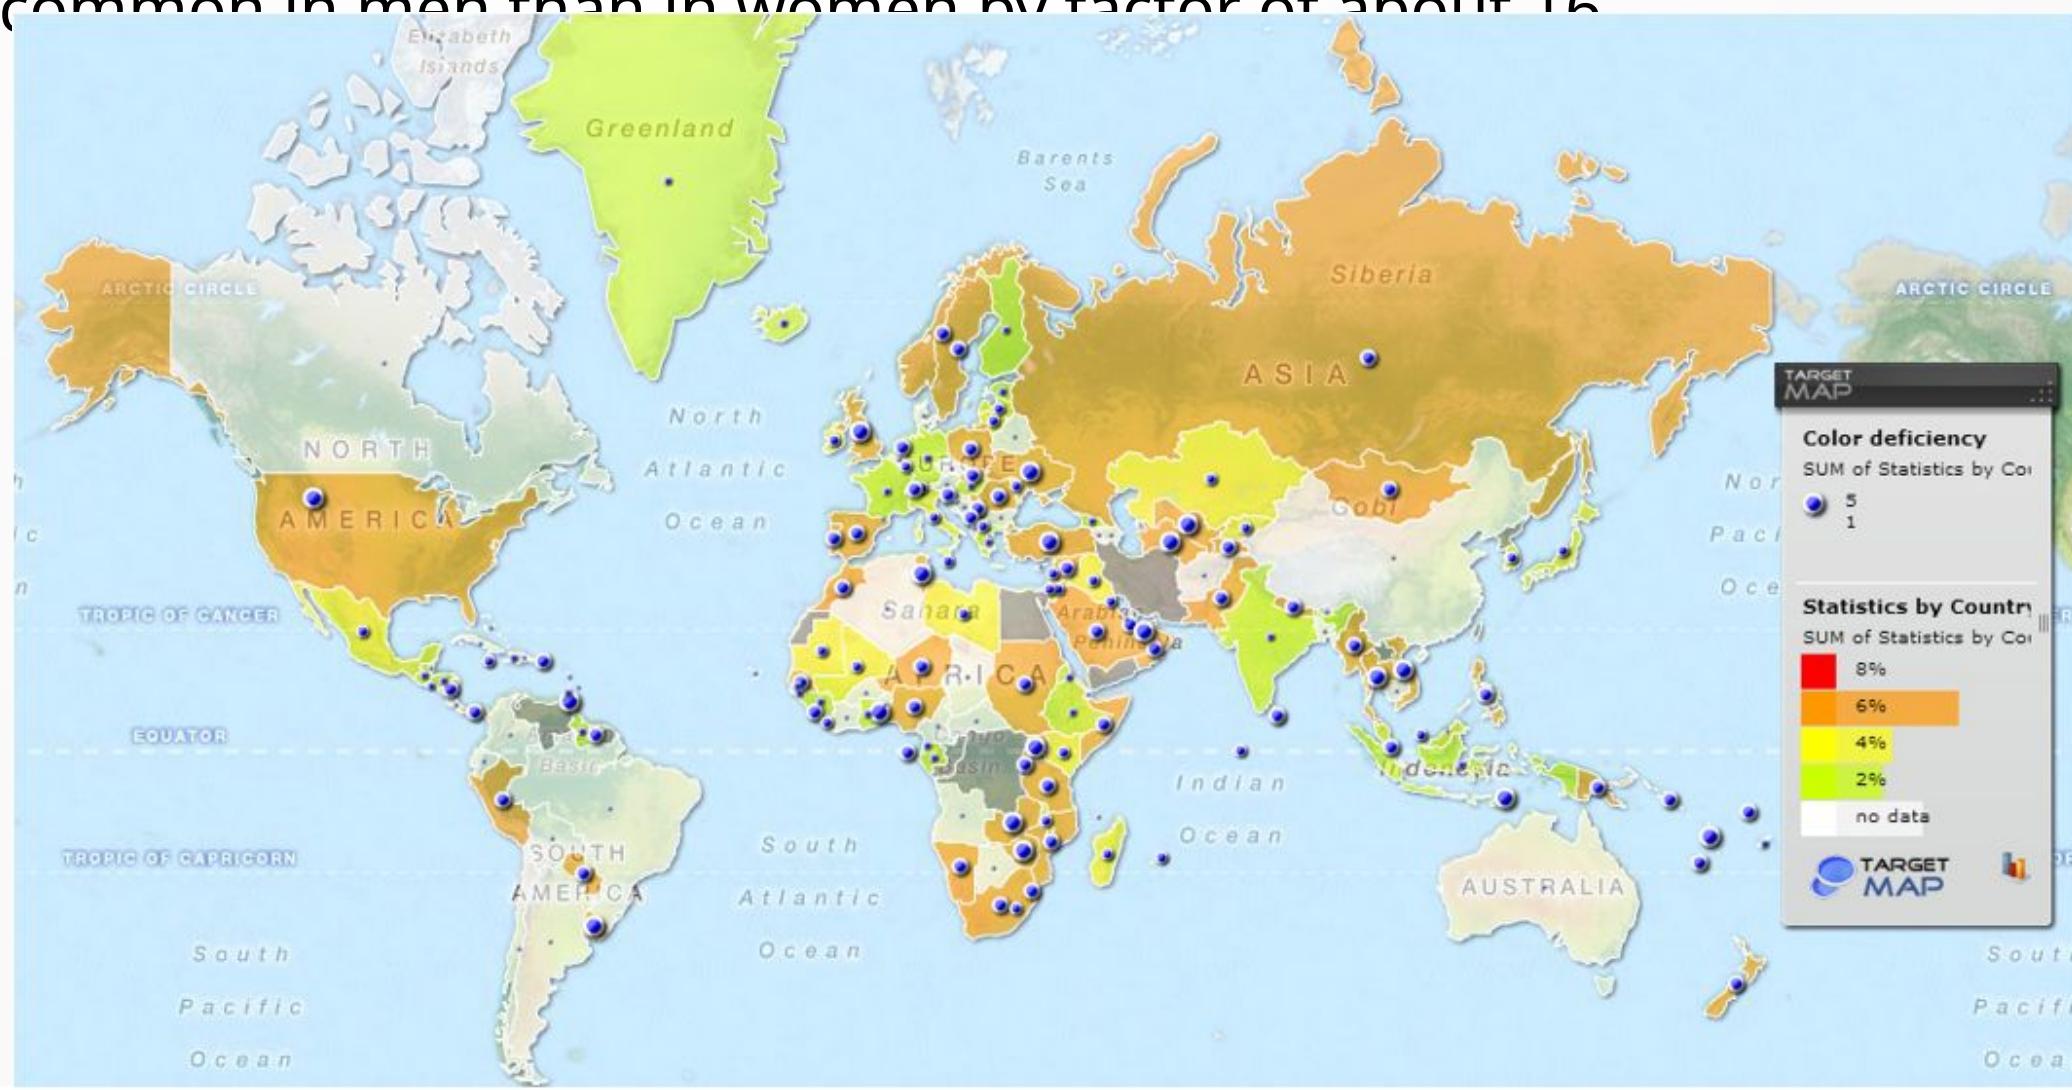

- Not all of you will be working on user facing tech
 - But all of you should be at least passingly familiar with first principles.
 - Dr. Liang covered several of these right?
 - At least accessibility?
 - Like?

Usability

- Not all of you will be working on user facing tech
 - Dr. Liang covered several of these right?
 - Accessibility?
 - Color schemes that work even for color-blind individuals
 - How common is color-blindness?
 - ref
 - <https://medium.com/@courtneyjordan/designing-for-all-users-why-you-should-care-about-color-blindness-beabd61943eb>

Usability

- How common is color-blindness?
 - More common in men than in women by factor of about 16

Usability

- Not all of you will be working on user facing tech
 - Accessibility?
 - Legal blindness.
 - Can your app be read by a text reader?
 - Deafness
 - Does your app require some auditory cues as the only way to function?
 - More?

Affordances

- 30+ years ago Don Norman wrote The Design of Everyday Things
 - Became **the** book for design in both engineering and CS design
 - 2013 revised edition is #1 and #5 in amazon's best seller list for the retail industry
 - #22 and #30 in the entire industry best seller list.

Affordances

- 30+ years ago Don Norman wrote The Design of Everyday Things
 - Perhaps the most important part of the book was the bringing cognitive/perceptual psychologist James J. Gibson's concept of affordances to the area of design.

Affordances

- Affordances:
 - Originally: perceptual inputs which took no cognition to understand what they were
 - In the Norman sense
 - An understanding of a 'thing' and its uses which is almost instinctual
 - The perceived properties of how a thing is used
 - Eg knobs are for turning.

Affordances

- Give me more examples of affordances in the real world

Affordances

- Give me more examples of affordances in the real world
 - for example if one of these was passed around when you were 12 what did you want to do to it?

Affordances

- What do each of these afford?
 - Light switch?
 -
 -

Affordances

- What do each of these afford?
 - Light switch?
 - Electric outlet?
 -
 -

Affordances

- What do each of these afford?
 - Light switch?
 - Electric outlet?
 - Glass panel?
 - Plywood panel?
 - Discuss Norman's experience with these last two (and DMF)

Affordances

- What do each of these afford?
 - Light switch?
 - Electric outlet?
 - Glass panel?
 - Plywood panel?
 - Discuss Norman's experience with these last two (and DMF)
 - Drywall panel example

Affordances

- What do each of these afford?
 - Light switch?
 - Electric outlet?
 - Glass panel?
 - Plywood panel?
 - Discuss Norman's experience with these last two (and DMF)
 - Button?

Affordances

- What do each of these afford?
 - Light switch?
 - Electric outlet?
 - Glass panel?
 - Plywood panel?
 - Discuss Norman's experience with these last two (and DMF)
 - Button?
 - Underlined blue text?
 -

Affordances

- What do each of these afford?
 - Light switch?
 - Electric outlet?
 - Glass panel?
 - Plywood panel?
 - Discuss Norman's experience with these last two (and DMF)
 - Button?
 - Underlined blue text?
 - Flat surface about 1.5 to 2 feet above the ground?

Affordances

- Use Affordances to make your UI easier
- Don't subvert affordances without very careful thought.
- Credit: Vox media article on
Don Norman

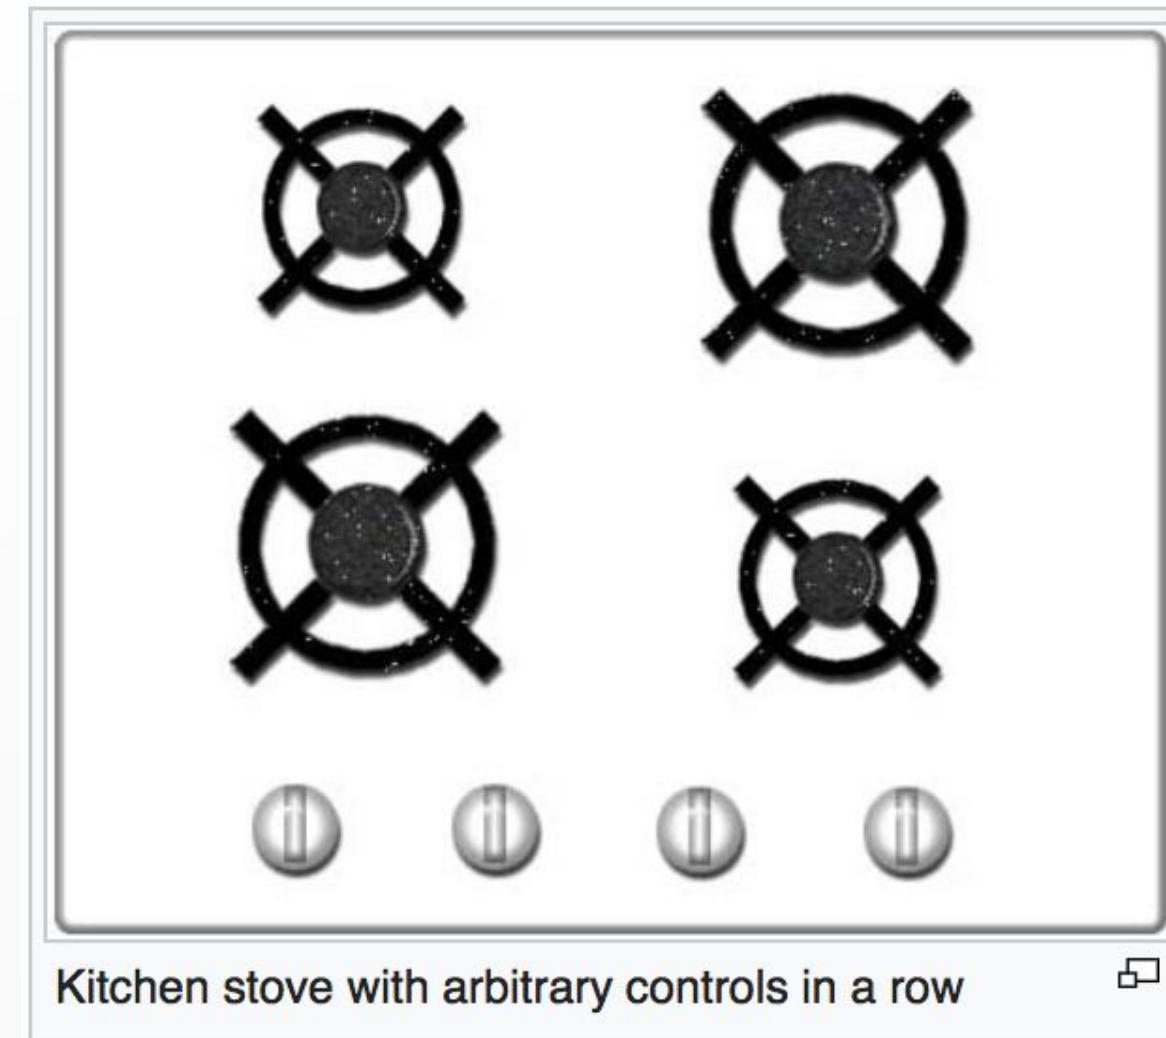

Mapping

- Mapping is a second seminal concept codified in the Design of Everyday things
 - Mapping is the notion that the connection from inputs to functionality should be easy to understand

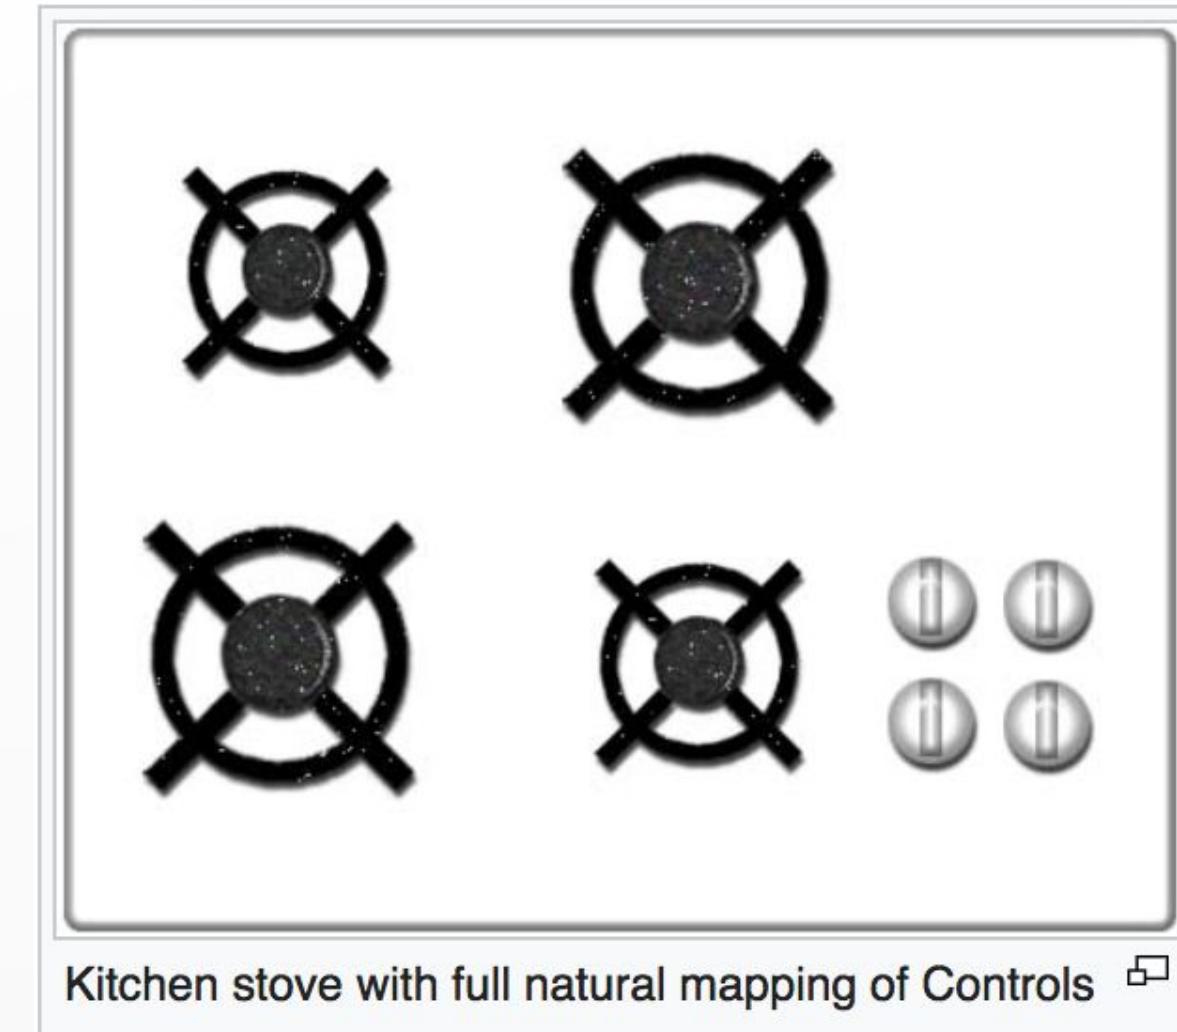

Bad Mapping

- Which control controls which burner in this stove?
image credit wikipedia

Natural mapping

- Which control goes with which burner here?
again wikipedia credit

Think about mapping

- When designing think about mapping
 - And feedback, when something happens/is happening make it clear to the user

Next: testing always

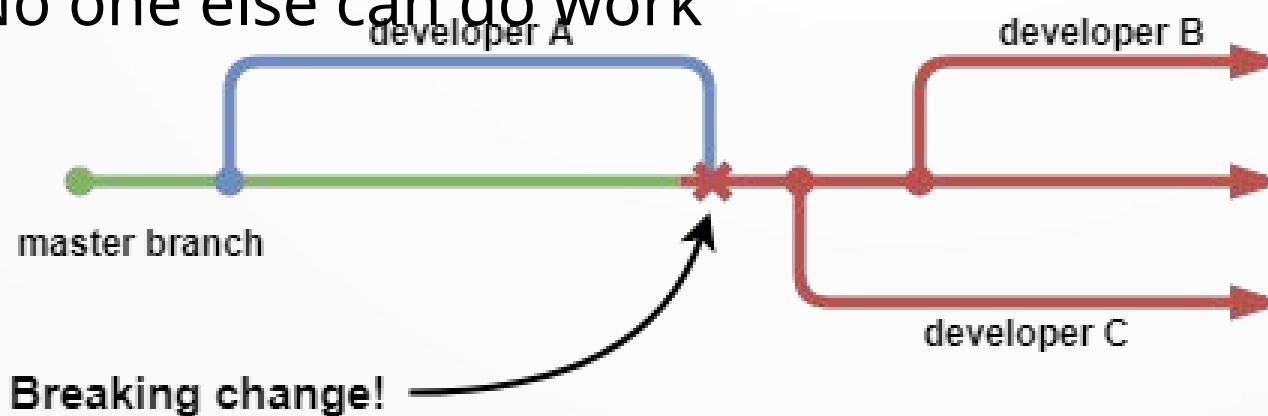

- Once your program is usable now we need to make sure your tests are always run before any commits of the software
- And once the tests pass and code is committed – immediately deploy it to production
- Continuous Integration (CI)/Continuous Delivery (CD)

CI: Intro

- Continuous Integration:
 - Basic idea: every time you commit/check in your code a script runs to do some work
 - Typical work:
 - Run automated tests
 - Run linters (pylint sonarlint for java etc)
 - Run formatters (black, rustfmt, gofmt etc)
 - For compiled languages, actually compile
 - If any of these fail then the check in/commit fails.
 - Frequently build software to shorten the feedback cycle

Why CI

- Don't break the build
 - Assuming a Git-like model
 - If Developer A merges changes that break the build
 - No one else can do work

Lots of CI choices

- Today there are a number of options for CI
 - Jenkins: granddaddy of them all
 - New version out recently
 - Originally needed to run on-prem server
 - TravisCI
 - Gained traction because of github integration
 - CircleCI
 - Runs as a service – hosted on their servers
 - GitLab
 - Gitlab launched as a github competitor
 - Added build in CI as a competitive option
 - And more (Atlassian etc)

Gitlab CI

- I'm going to use Gitlab CI for most of my examples
 - Available on their free tier
 - Another cloud hosted git repository like github which we are already using.
 - Gitlab is a github competitor in the cloud git repository space
 - Distinguishing itself with this sort of offering

Compare GitLab CI Pricing			
Free	Bronze	Silver	Gold
<p>Helping developers build, deploy, and run their applications.</p> <p>\$0 per user per month</p> <p>Sign Up</p> <p>2,000 CI pipeline minutes per group per month on our shared runners</p> <p>Unlimited private projects and collaborators</p> <ul style="list-style-type: none">→ Community Support→ Built-in CI/CD→ Project Issue Board→ ChatOps	<p>Enabling teams to speed DevOps delivery with automation, prioritization, and workflow.</p> <p>\$4 per user per month (billed annually)</p> <p>Buy Now</p> <p>2,000 CI pipeline minutes per group per month on our shared runners</p> <ul style="list-style-type: none">→ Next business day Support→ Multiple approvals in code review→ Merge approvals→ Code Quality	<p>Enabling IT to scale DevOps delivery with progressive deployment, advanced configuration, and consistent standards.</p> <p>\$19 per user per month (billed annually)</p> <p>Buy Now</p> <p>10,000 CI pipeline minutes per group per month on our shared runners</p> <ul style="list-style-type: none">→ Priority Support→ Multi-project pipeline graphs→ Deploy Boards→ Timed and manual incremental rollout deployments→ Canary Deployments	<p>Enabling businesses to transform IT by optimizing and accelerating delivery while managing priorities, security, risk, and compliance.</p> <p>\$99 per user per month (billed annually)</p> <p>Buy Now</p> <p>50,000 CI pipeline minutes per month on our shared runners and a 4-hour Support SLA.</p> <ul style="list-style-type: none">→ Multi-level Epics→ Roadmaps→ Portfolio Management→ Application performance alerts→ Security Dashboards→ Container Scanning→ Dynamic Application Security Testing

GitLab: new project

- A newly created project in gitlab:
- Lets look at what is different than github
- What follows is an edited diary of my learning so you can too

The screenshot shows the 'Details' page for a new project named 'comp490CIDemo'. The project ID is 11749633. It has 1 commit, 1 branch, 0 tags, and 0 bytes of files. A 'Auto DevOps' section is present, showing a 'Cloud' icon with a checkmark and gears, and a description: 'It will automatically build, test, and deploy your application based on a predefined CI/CD configuration.' A 'Learn more in the Auto DevOps documentation' link and an 'Enable in settings' button are also shown. The commit history lists an 'Initial commit' by JohnSantore 3 minutes ago, with the commit hash 7ed8663a. Below the commit history are buttons for 'README', 'Add CHANGELOG', 'Add CONTRIBUTING', 'Add Kubernetes cluster', and 'Set up CI/CD'. A table shows file details: 'README.md' (Last commit: Initial commit, Last update: 3 minutes ago). The project name 'comp490CIDemo' is also displayed.

Name	Last commit	Last update
README.md	Initial commit	3 minutes ago

comp490CIDemo

CI Pipelines

- Central to most CI workflows is the notion of a CI pipeline
- Multiple steps possible in the pipeline
 - Each step can have multiple parallel jobs running
 - Each step can use the output from earlier steps
 - But each job in a step can't assume output from its peers

Pipelines

Example Here:

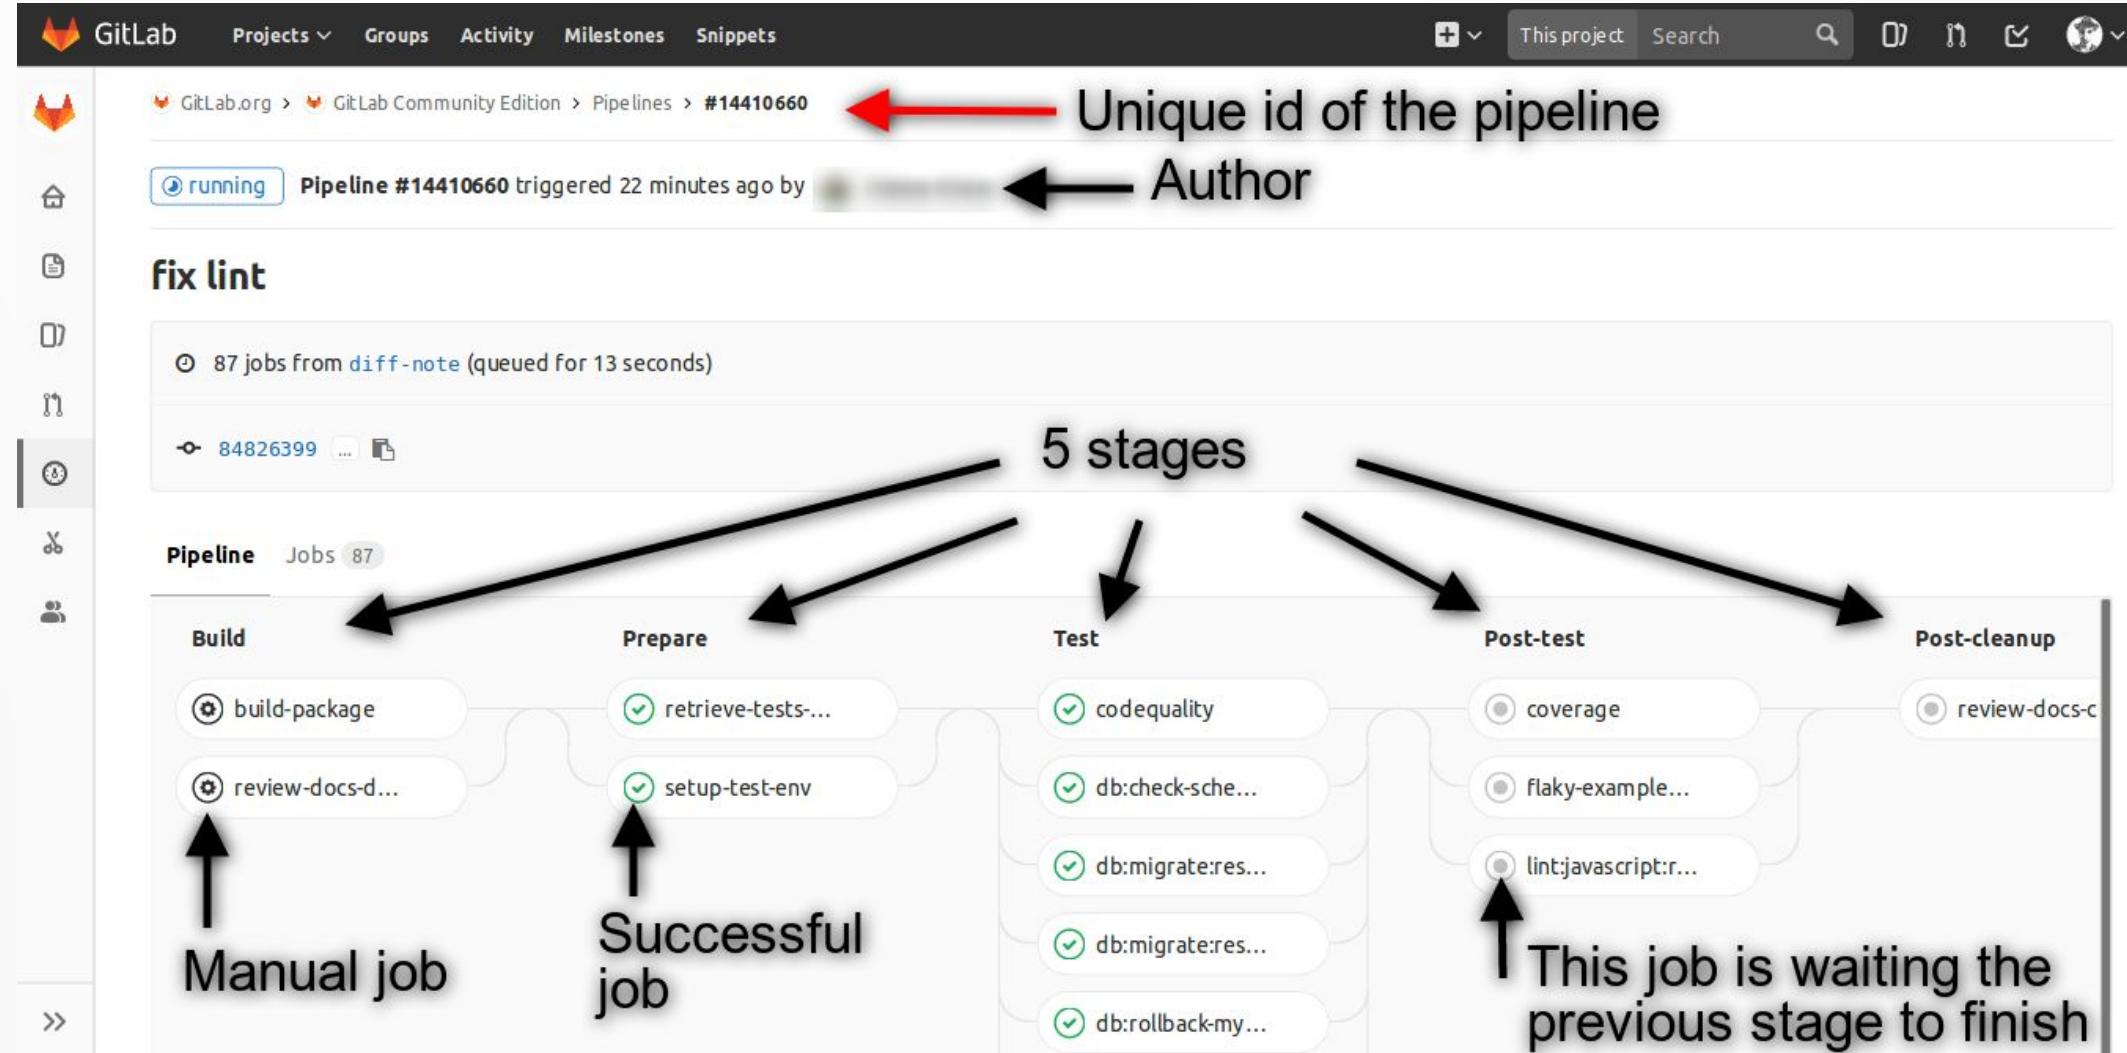

image credit:

<https://about.gitlab.com/2018/01/22/a-beginners-guide-to-continuous-integration/>

What sort of pipelines

- Based on our discussions so far
 - Or your own experience
 - What sorts of things should CI do for us?

What sort of pipelines

- Based on our discussions so far
 - Or your own experience
 - What sorts of things should CI do for us?
 - Likely answers include
 - Running a linter (or formatter)
 - Compiling (or running code through interpreter)
 - Running automated tests
 - Sending changes to deployment

Setting up CI/CD

- Setting up GitLab CI/CD uses a yaml file
- To right is simple example from Zuri Hunter's medium writeup

```
stages:  
  - build  
  - test  
  - deploy
```

```
before_script:  
  - npm install
```

```
build-min-code:  
  stage: build  
  script:
```

```
    - npm install  
    - npm run minifier
```

```
run-unit-test:  
  stage: test  
  script:  
    - npm run test
```

```
deploy-staging:  
  stage: deploy  
  script:  
    - npm run deploy-stage
```

A Deeper look

- So lets continue with our example
 - I have the floodfill from the makeup project
 - I need to work on that

```
johns@Cicero:~/workspace/Spring2019/Capstone$ git clone https://gitlab.com/comp490seniordesign/comp490cidemo.git
Cloning into 'comp490cidemo'...
Username for 'https://gitlab.com': profsantore
Password for 'https://profsantore@gitlab.com':  
remote: Enumerating objects: 6, done.
remote: Counting objects: 100% (6/6), done.
remote: Compressing objects: 100% (4/4), done.
remote: Total 6 (delta 0), reused 0 (delta 0)
Unpacking objects: 100% (6/6), done.
```

- Then I opened it in pycharm
 - Created a test folder and a first test
 - I used pycharm's vcs integration to add it to git and commit
 - Then I pushed the changes to the gitlab project

Like this

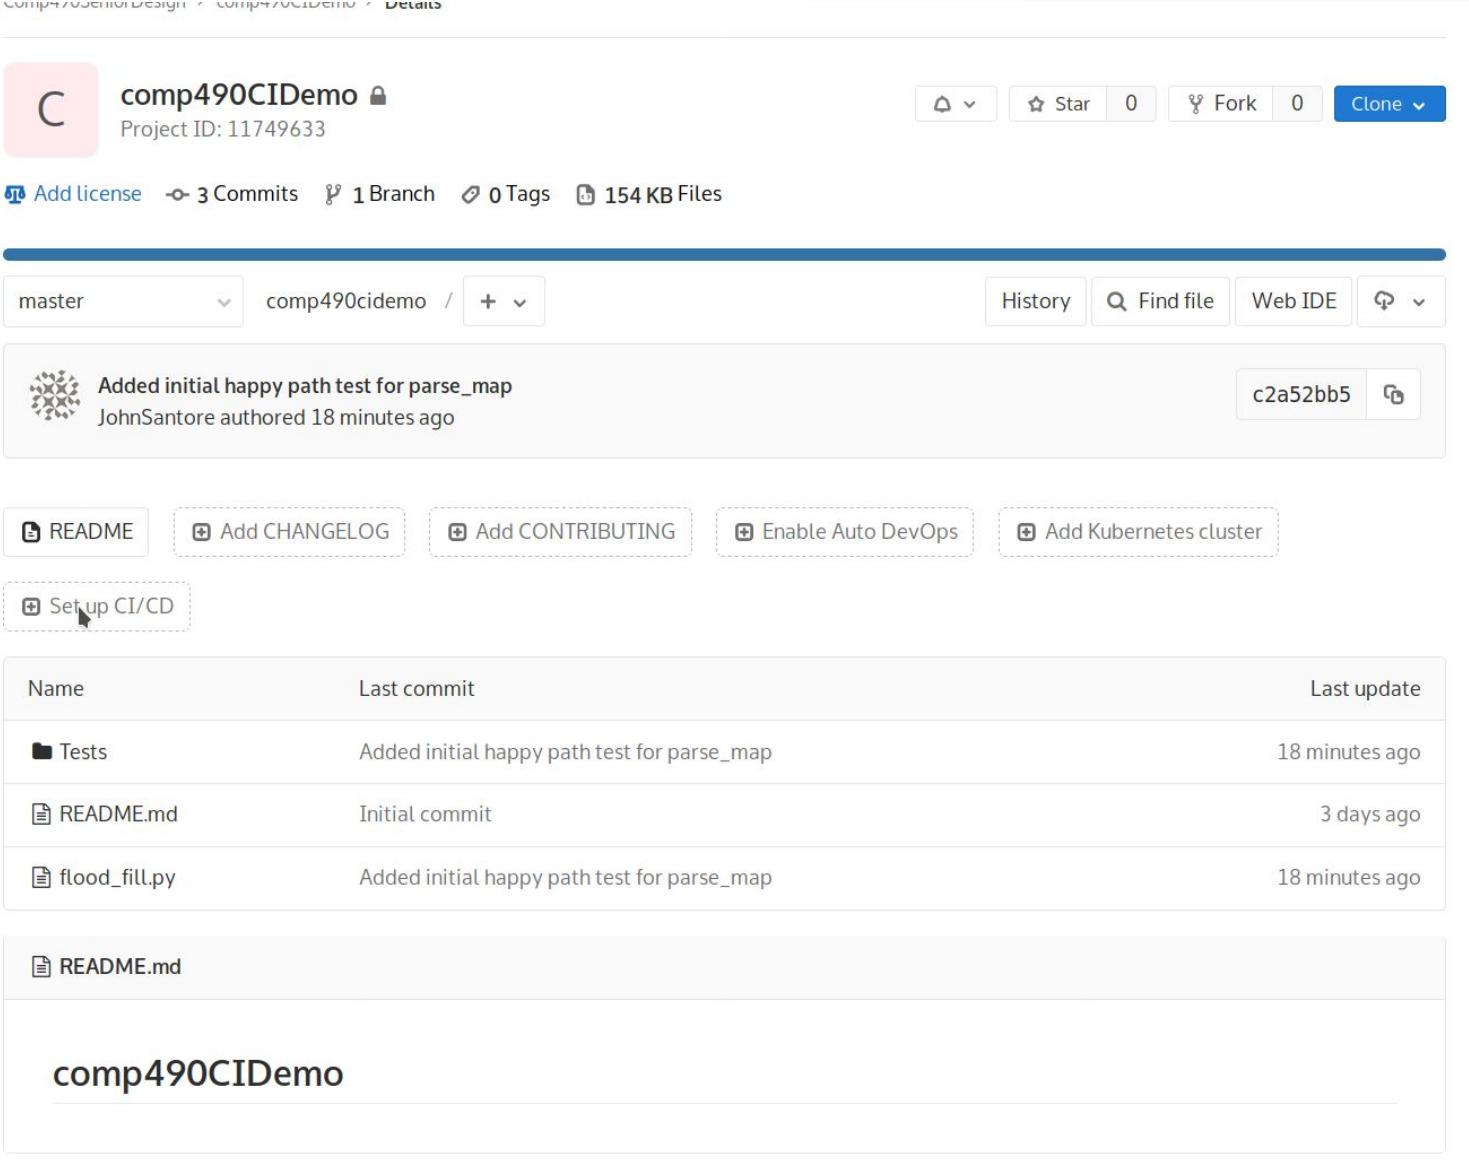

- Here was my update:

```
johns@Cicero:~/workspace/Spring2019/Capstone/comp490cidemo$ git push https://gitlab.com/comp490seniordesign/comp490cidemo.git
Username for 'https://gitlab.com': profsantore
Password for 'https://profsantore@gitlab.com':
Counting objects: 5, done.
Delta compression using up to 4 threads.
Compressing objects: 100% (4/4), done.
Writing objects: 100% (5/5), 670 bytes | 670.00 KiB/s, done.
Total 5 (delta 1), reused 0 (delta 0)
To https://gitlab.com/comp490seniordesign/comp490cidemo.git
  ac18c2f..c2a52bb  master -> master
```

- Caveat, disclaimer, best practices, merge/pull requests, fast and beginner, etc.
- Ok – now we have a test, furthermore, maybe I want to run a linter (flake8 is what I'll use here)

Setup CI on Gitlab

- So lets setup CI directly on Gitlab

The screenshot shows a Gitlab project page for 'comp490CIDemo' (Project ID: 11749633). The page displays basic project statistics: 3 Commits, 1 Branch, 0 Tags, and 154 KB Files. Below the stats, a commit history is shown with the most recent commit being 'Added initial happy path test for parse_map' by JohnSantore 18 minutes ago. A prominent 'Set up CI/CD' button is highlighted with a dashed border. The page also includes links for README, CHANGELOG, CONTRIBUTING, Auto DevOps, and Kubernetes cluster setup.

Name	Last commit	Last update
Tests	Added initial happy path test for parse_map	18 minutes ago
README.md	Initial commit	3 days ago
flood_fill.py	Added initial happy path test for parse_map	18 minutes ago
README.md		

comp490CIDemo

Creates the gitlab-ci.yml

- Using the online ide

Comp490SeniorDesign > comp490CIDemo > Repository

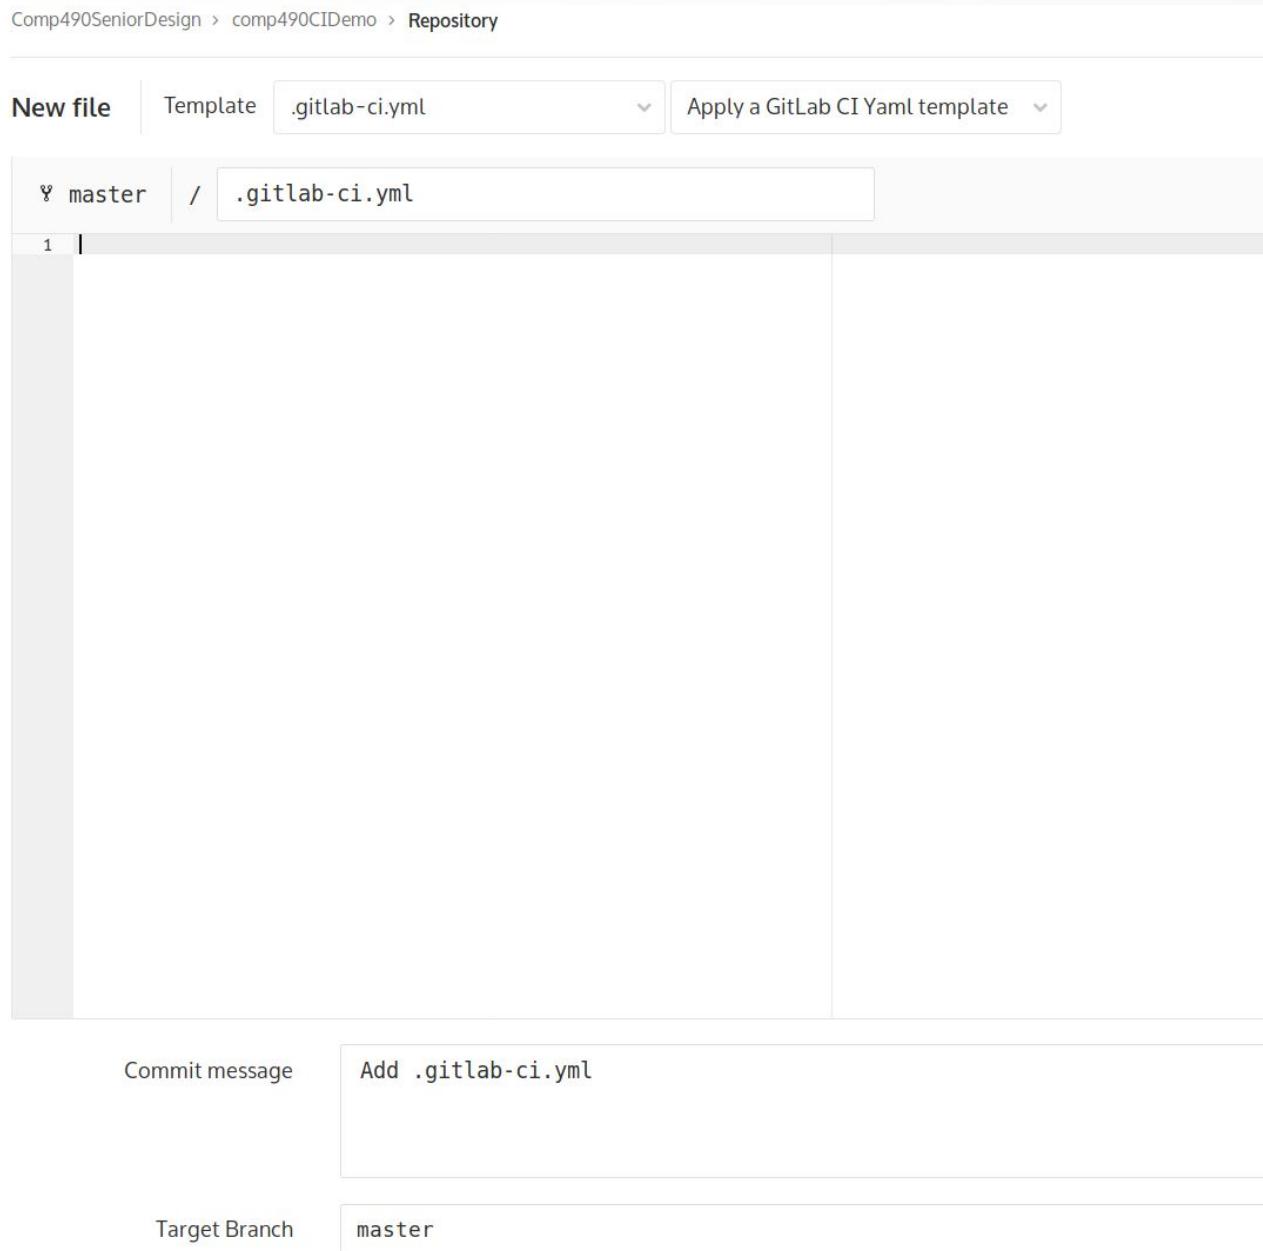

New file Template .gitlab-ci.yml Apply a GitLab CI Yaml template

master / .gitlab-ci.yml

1 |

Commit message Add .gitlab-ci.yml

Target Branch master

Templates

- Gitlab has templates for many languages

The screenshot shows the GitLab CI interface. At the top, there are dropdown menus for 'Template' (set to '.gitlab-ci.yml') and 'Language' (set to 'Python'). To the right of these is a 'Template applied' button and an 'Undo' button. Below this, the main area shows a file tree with a file named '.gitlab-ci.yml'. The content of this file is a YAML configuration for a Python project. A modal window titled 'Apply a template' is open on the right, listing various languages and tools: PHP, Packer, Python (with a cursor arrow pointing to it), Ruby, Rust, Scala, and Serverless. A 'Filter' input field is also present in the modal.

```
language: python
cache:
  paths:
    - .cache/pip
    - venv/
before_script:
  - python -V          # Print out python version for deb
  - pip install virtualenv
  - virtualenv venv
  - source venv/bin/activate
test:
  script:
    - python setup.py test
    - pip install tox flake8 # you can also use tox
    - tox -e py36,flake8
run:
  script:
    - python setup.py bdist_wheel
    # an alternative approach is to install and run:
    - pip install dist/*
    # run the command here
artifacts:
  paths:
    - dist/*.whl
```

Example

- So I used the python template and removed the packaging stuff

```
image: python:latest

# Change pip's cache directory to be inside the project directory
# since we can only cache local items.
variables:
  PIP_CACHE_DIR: "$CI_PROJECT_DIR/.cache/pip"

# Pip's cache doesn't store the python packages
# https://pip.pypa.io/en/stable/reference/pip_install/#caching
# If you want to also cache installed packages, you have to
# install them in a virtualenv and cache it as well.
cache:
  paths:
    .cache/pip
    venv/

before_script:
  python -V          # Print out python version for debugging
  pip install virtualenv
  virtualenv venv
  source venv/bin/activate

test:
  script:
    python setup.py test
```

Image

- Image specifies a docker image
 - Anything on docker hub should work (I only tried some python images)
 - <https://hub.docker.com/>
 -

Before_script

- before_script:
 - This section runs before each job
 - In our case setting up a python virtual env
 - Discuss if needed

Test:

- Test:
 - Section is our only current job
 - The script had more
 - If any item here fails, the whole pipeline fails.
- Can have an arbitrary number of jobs

At this point I went home

- And when I got there
I had mail

✖ Your pipeline has failed.	
Project	Comp490SeniorDesign / comp490CIDemo
Branch	master
Commit	→ 68f1473c Add .gitlab-ci.yml - started from the gitlab py...
Commit Author	JohnSantore

Pipeline #56412394 triggered by JohnSantore
had 1 failed build.

Logs may contain sensitive data. Please consider before forwarding this email.	
✖ test	test
\$ virtualenv venv Using base prefix '/usr/local' New python executable in /builds/comp490seniordesign/comp490cidemo/venv/bin/python Installing setuptools, pip, wheel... done. \$ source venv/bin/activate \$ python setup.py test python: can't open file 'setup.py': [Errno 2] No such file or directory ERROR: Job failed: exit code 1	→

Simplify

- So I simplified the Ci/CD pipeline

```
# Change pip's cache directory to be inside the project directory
#since we can only cache local items.
variables:
  PIP_CACHE_DIR: "$CI_PROJECT_DIR/.cache/pip"
```

```
# Pip's cache doesn't store the python packages
# If you want to also cache the installed packages, you have to
#install them in a virtualenv and cache it as well.
```

```
cache:
```

```
  paths:
```

- .cache/pip
- venv/

```
before_script:
```

- python -V # Print out python version for debugging
- pip install virtualenv
- virtualenv venv
- source venv/bin/activate

```
test:
```

```
  script:
```

```
  #- python setup.py test
```

```
  - pip install tox flake8 pytest # you can also use tox
```

```
  #- tox -e py36,flake8 # look at this more enterprise way of later
```

Code not following style

- So my CI fails the build because I'm not following the style guide - again let the computer check it:

```
$ flake8 flood_fill.py
flood_fill.py:1:1: E265 block comment should start with '# '
flood_fill.py:1:80: E501 line too long (109 > 79 characters)
flood_fill.py:3:1: E265 block comment should start with '# '
flood_fill.py:4:1: E265 block comment should start with '# '
flood_fill.py:13:31: E231 missing whitespace after ':'
flood_fill.py:19:28: E261 at least two spaces before inline comment
flood_fill.py:19:29: E262 inline comment should start with '# '
flood_fill.py:20:11: E111 indentation is not a multiple of four
flood_fill.py:25:11: E111 indentation is not a multiple of four
flood_fill.py:77:24: E711 comparison to None should be 'if cond is not None:'
flood_fill.py:106:55: E712 comparison to False should be 'if cond is False:' or 'if not cond:'
flood_fill.py:111:80: E501 line too long (80 > 79 characters)
flood_fill.py:127:51: E712 comparison to False
flood_fill.py:131:80: E501 line too long (80 > 79 characters)
flood_fill.py:131:80: E502 the backslash is unnecessary
flood_fill.py:132:69: E712 comparison to False
flood_fill.py:255:41: E251 unexpected spaces around keyword / parameter equals
flood_fill.py:255:43: E251 unexpected spaces around keyword / parameter equals
flood_fill.py:259:3: E111 indentation is not a multiple of four
flood_fill.py:260:3: E111 indentation is not a multiple of four
flood_fill.py:260:34: E231 missing whitespace after ','
flood_fill.py:261:3: E111 indentation is not a multiple of four
flood_fill.py:262:3: E111 indentation is not a multiple of four
flood_fill.py:266:11: W292 no newline at end of file
ERROR: Job failed: exit code 1
```

Dot dot dot

- I did a bit of trial and error learning the ins and outs of these tools on the command line that I've used from pycharm locally
 - I edited .gitlab-ci.yml to run flake8 –max-line-length=100
 - And turned the pytest line to python -m pytest
 - pytest Tests/test_flood_fill.py
 - Became
 - python -m pytest
 - Reason: when run as python -m pytest then current working directory is root of tests (for import statements) also pytest will look in directories named **Test** for files for the sort `test_something.py`

Style guides

- So the code I extended wasn't following the style
 - And I introduced two style issues myself
 - Pycharm autofixed about 80% of it
 - I changed all the
 - if expression == False:
 - To
 - if not expression:
 - And fixed my doc string ('→ "')
 - And checked the code back in.

Check in - pipelines running

- Check in - running CI

Update .gitlab-ci.yml

The screenshot shows a GitLab interface for a merge request. At the top, it says "parent a9464347" and "master". Below that, there are two small circular icons. Further down, a message says "Pipeline #56564196 running with stage".

Below this, there are two tabs: "Changes 1" and "Pipelines 1". The "Pipelines 1" tab is selected, indicated by a blue underline. Under this tab, there is a table with columns: "Status", "Pipeline", "Commit", and "Stages".

The table data is as follows:

Status	Pipeline	Commit	Stages
	#56564196 by latest	-o ac7452a6 Update .gitlab-ci.yml	

A large blue arrow points from the text "Click here" to the "Stages" column header.

Click here

And Success!

- Finally I don't have email from gitlab

```

Any questions

- Anyone not quite there on your version of the project?
- Please help your neighbors and I'll be around

Now lets do real work

- We have our project in the basics of shape
 - But we only have one happy path test.
 - Lets do a more complete test
 - Uncomment the commented test in the `test_flood_fill` file. It tries to load a non-existent file. That should do something sane, like return an empty list – not throw exception
 - Commit to gitlab and the tests will automatically run and show the error

The failed test

As those of you who did the makeup project discovered, the parse_map function isn't very robust

```
Tests/test_flood_fill.py:20:  
-----  
file_name = 'lkj nc qgfwcaelkjh.txt'  
  
def parse_map(file_name: str):  
    """  
        this function might have problems, but testing will find that.  
    """  
>     map_file = open(file_name, encoding='UTF-8') # the encoding-'UTF-8' is only needed for windows  
E     FileNotFoundError: [Errno 2] No such file or directory: 'lkj nc qgfwcaelkjh.txt'  
  
flood_fill.py:242: FileNotFoundError  
===== 1 failed in 0.03 seconds =====
```

TDD after all

- Now let's do us some test driven development
 - We have a failing test, how do we make it pass?

How should we fix the issue

- ? students suggest and we try it

My solution

- My solution below, passes tests

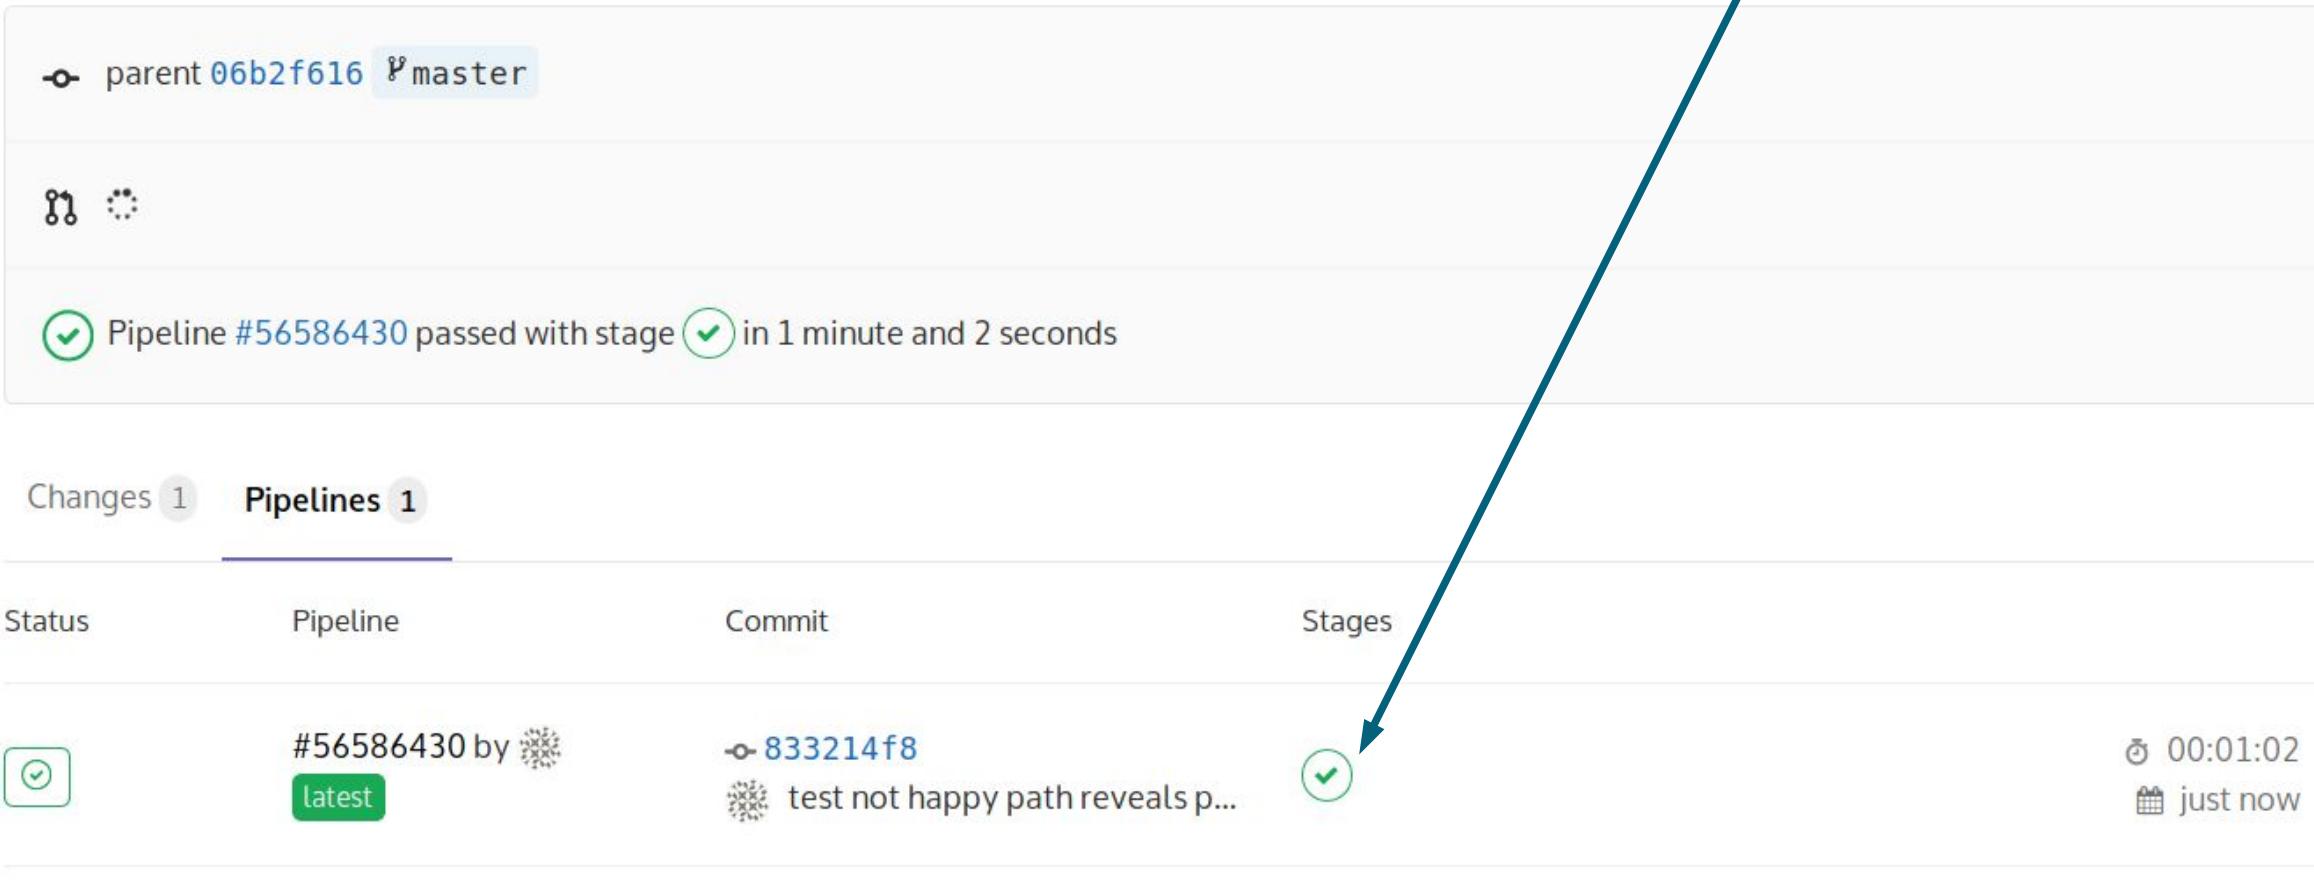

```
def parse_map(file_name: str):  
    """  
    this function might have problems, but testing will find that.  
    """  
  
    map_representation = []  
    try:  
        map_file = open(file_name, encoding='UTF-8')  # the encoding-'UTF-8'  
needed for windows  
        lines = map_file.readlines()  
    except (FileNotFoundException, PermissionError):  
        return map_representation  
    for line in lines:  
        line = list(map(int, line.split(',')))  
        map_representation.append(line)  
    return map_representation
```

And commit works

- After the commit:

test not happy path reveals problem with parse_map

update parse map to fix the issue

A screenshot of a CI pipeline interface. At the top, a message says "Click here and choose test". A blue arrow points from this text to the "Stages" column of the pipeline table. The pipeline table has columns: Status, Pipeline, Commit, and Stages. The first row shows a green checkmark in the Status column, the Pipeline "#56586430" in the Pipeline column, a commit hash "833214f8" in the Commit column, and a green checkmark in the Stages column. The pipeline status is "passed".

Status	Pipeline	Commit	Stages
	#56586430 by	833214f8 test not happy path reveals p...	

00:01:02 just now

Yes – we fixed the error!

- Now our pipeline is working like it should

```
pytest) (7.0.0)
Requirement already satisfied: attrs>=17.4.0 in ./venv/lib/python3.7/site-packages (from pytest) (19.1.0)
$ flake8 --max-line-length=100 flood_fill.py
$ python -m pytest
===== test session starts =====
platform linux -- Python 3.7.3, pytest-4.4.0, py-1.8.0, pluggy-0.9.0
rootdir: /builds/comp490seniordesign/comp490cidemo
collected 1 item

Tests/test_flood_fill.py . [100%]

===== 1 passed in 0.03 seconds =====

Now lets continue

- I wrote that function to have an issue for the makeup assignment
- Lets go from here. Lets choose a function, write a test for it, commit and git push and let our CI pipeline run the tests automatically
- If the test fails we'll edit the real code
- Huzzah!
